

DESIGN // BUILD // GROW

# The CT Greenhouse Difference

When you work with CT Greenhouse, you get more than a high-quality product; you get a partner that will work with you to select and create the perfect solution for your farm.

## Design Backed by Combined 20 Years Experience

We're farmers, and we bring that expertise to everything we do, which is why our Greenhouses and high tunnels are designed with you in mind.

- Industry-leading sidewall height improves airflow, reducing pests and disease and creating more room to grow trellised crops.
- Future-proof your farm! Our kits easily accept ridge vents, and our end wall framing design allows for easy upgrades in the future.
- While some vendors cut pieces shorter to ease their own shipping logistics, we design for strength and durability. Our first concern is always the customer's experience — not our own shipping costs.

## Key Benefits

### No Heavy Machinery Needed

Building a CT Greenhouse requires no specialized tools or heavy machinery. You can accept delivery and build the whole kit with the common tools found on your farm.

### Shipping Logistics

As you search for the right greenhouse supplier, be sure to ask about delivery: How will it happen? What equipment and time resources will it require? We guarantee that CT Greenhouse will provide the simplest delivery system out there.

### Assembly and Construction

All of our kits come with fast and easy-to-follow instructions, and our greenhouses are designed with simplicity in mind. All major frame connections are thru-bolted, and it's simple to raise bows into place without the need for machinery.

## Frequently Asked Questions

### ? Do you provide a complete kit?

Yes! We provide everything you need to start growing right away. The only thing you need to supply is baseboards.

---

### ? How tall are the sidewalls?

Sidewall height will depend on ground posts, but ranges from 5.5–6'. CT Greenhouse uses 5' ground posts.

### ? Why does CT Greenhouse use shorter ground posts than other vendors?

We use longer pieces of steel in the main frame, meaning that a 5' ground post from CT Greenhouse results in the same overall height of a greenhouse with a 6–8' ground post from another supplier.

What's the benefit? Shorter ground posts are simpler to install — and therefore simpler to add bows on top of. You get the same height and durability plus the added benefit of an easy installation!

Build quality was extremely high; instructions thorough and easy to follow; service was prompt and generous; ordering and delivery was quick and easy. We are extremely grateful for CT Greenhouse and glad we chose them!
